## Highlights

- A new fuzzy envelope of HFLTS is proposed.
- A new cosine similarity measure for HFLTSs is defined.
- An adjusted cosine similarity measure is developed for HFLTSs.
- A linear programming model is constructed to derive the criteria weights.
- A cosine similarity based QUALIFLEX approach for financial performance evaluation.

**Abstract.** The financial performance evaluation is important for investors of listed companies to make investment decisions. It enables investors to avoid haphazard investment and make a better decision in the capital market with high risk. Financial performance evaluation can be formulated as a kind of multi-criteria decision making (MCDM) problems with hesitant fuzzy linguistic term sets (HFLTSs). Considering that the number of criteria markedly exceeds the number of alternatives in real-world financial performance evaluation, this paper aims to develop a cosine similarity based QUALIFLEX (QUALitative FLEXible multiple criteria method) approach for MCDM with HFLTSs to effectively solve such problems. Firstly, a new fuzzy envelope of HFLTS is proposed using a Bonferroni mean
