This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

# Simulated Annealing for a Multi-Level Nurse Rostering Problem in Hemodialysis Service

## Graphical abstract

An effective simulated annealing algorithm (SA) based on a fast heuristic algorithm is developed for solving a multi-level nurse rostering problem in hemodialysis service (MLHSNRP) compared with a hybrid artificial bee colony algorithm (HABC). The problem is motivated by real cases in some hemodialysis center in Wuhan, China. The results of computational experiments show that SA has a better performance as a whole, SA and HABC respectively have advantages on problems of different scales, and SA runs faster than HABC.

## Highlights

- Multi-level nurse rostering in hemodialysis service with preference on roles and shifts.
- A synthetic objective 0-1 integer programming model formulated.
- A fast heuristics algorithm developed.
- A simulated annealing algorithm with three neighborhood structures.
