This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

### Highlights

- Employ geometrically exact beam theory (GEBT) and Jaumann strain formulation for curved beams.
- NURBS basis functions enable to incorporate the exact description of initial geometry such as initial curvature and its tangential derivative.
- Develop an isogeometric configuration DSA method for curved beams with multi-patch junctions.
- C0-continuity of physical displacement or C1-continuity of displacement component at junction is weakly imposed using the Lagrange multiplier method.
- Orientation design variation is exactly expressed by rotational transformation of local coordinates and the GEBT.
