An efficient and robust rotational formulation for isogeometric
Reissner–Mindlin shell elements

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

A rotation-based isogeometric Reissner-Mindlin shell formulation which is able to handle finite rotations and large deformations is presented.

A continuous rotation of the director vector with multiplicative update ensures robust computations of arbitrarily curved structures

Three integration schemes are presented and compared in terms of computational costs and influence on accuracy

The efficiency of the proposed shell formulation is shown to be competitive to standard Lagrange-based finite element shell formulations
