This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- A high-order density-based finite-volume framework for all-speed flows is presented
- High-order Roe and Rusanov finite volume schemes for all speed flow are developed.
- MLS-based shock wave sensor prevents unnecessarily activation of the slope limiter.
- This avoids the presence of spurious pressure oscillations in low-Mach regions.
