This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- * We design a locally quadratically convergent algorithm for topology optimization
- * The complexity of finding the Newton's direction is comparable with that of one finite element analysis
- * The algorithm outperforms several existing approaches to topology optimization on the benchmark problems of power minimization of Stokes flows
- * The algorithm's convergence rate is mesh or discretization independent on benchmark problems
