Interface-preserving level set method for simulating dam-break flows

Z.H. Gu, H.L. Wen, C.H. Yu, Tony W.H. Sheu

PII: S0021-9991(18)30520-5
DOI: <https://doi.org/10.1016/j.jcp.2018.07.057>
Reference: YJCPH 8183

To appear in: *Journal of Computational Physics*

Received date: 11 August 2017
Revised date: 8 February 2018
Accepted date: 31 July 2018

Please cite this article in press as: Z.H. Gu et al., Interface-preserving level set method for simulating dam-break flows, *J. Comput. Phys.* (2018), <https://doi.org/10.1016/j.jcp.2018.07.057>

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A three-dimensional interface-preserving level set method is developed in two steps to simulate dam break flow problems.
- A dispersion-relation-preserving compact reconstruction weighted essentially non-oscillatory (DRP-CRWENO4) which achieves high-order accuracy with low dispersion error at smooth regions and switches to compact candidate stencils to avoid oscillations near discontinuities is developed.
- Three benchmark cases including linear wave propagation, Zalesak's disk, and a vortex deforming problem are simulated to validate the proposed DPP-CRWENO4 scheme.
- Dam break flows with/without solid obstacle are successfully simulated through the comparison of the predicted results with their corresponding experimental or other numerical results.
