This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- An improved projection method of imposing boundary conditions is presented.
- Treats the case when initial and boundary data are inconsistent.
- Comparisons to the well-known SAT method of imposing boundary conditions.
- SAT yields much larger spectral radii, compared to the improved projection method.
- Computations of 1D and 2D problems corroborate the stability and accuracy behavior.
