This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A novel paradigm of spatial reconstruction for compressible multi-phase flows with free interfaces.
- Consistency among volume fraction and physical variables across moving material interfaces.
- Well resolved moving interface free from numerical dissipation and smearing.
- Algorithmic simplicity, computational efficiency and practical significance.
- Superior numerical results for wide range benchmark tests to other existing methods.
