This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- An optimization approach for high-order accurate resolution of shocks is proposed.
- Element faces of DG method align with unknown location to accurately represent shock.
- A new monotonic discontinuity indicator makes optimization-based tracking practical.
- Full space optimization solver critical for robustness of proposed tracking method.
- Method accurately resolves supersonic, 2D flow with as few as 2000 DOFs.
