This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The discontinuous Galerkin spectral element (DGSEM) is generalized to mixed triangular and quadrilateral grids.
- The influence of insufficient SCP quadrature to DGSEM is analyzed.
- The dispersion and dissipation property of DGSEM on triangular grids is given and compared with that of nodal DG method.
- A problem independent limiting procedure containing a new high-resolution WENO limiter is proposed for capturing shock waves.
- The DGSEM scheme is applied to solve the two dimensional compressible flows on mixed grids.
