This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- New reformulations of recently introduced fully nonlinear and weakly dispersive free surface shallow water models are proposed.
- Decoupling strategies are investigated, in which we approximate the solutions of the classical shallow water equations supplemented with source terms globally accounting for the non-hydrostatic effects.
- SWIP-DG discrete formulations of arbitrary spatial order are carefully and systematically designed for these models, allowing to deal with the discontinuous nature of the elliptic problems coefficients in a stable and consistent way.
- Discrete gradient and discrete Laplace operators are introduced in order to account for the nonconformity of the discrete functions.
