This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We develop a new formulation and associated numerical algorithm for the simulation of combustion and transition to detonation of condensed-phase commercial- and military-grade explosives, which are confined by (or in general interacting with one or more) compliant inert materials.
- Several Mie–Grüneisen type equations of state (EoS) and reaction rate laws have been implemented and validated.
- An extensive review of current formulations is presented.
- A very extensive validation and evaluation suite is carried out.
