This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## **Highlights**

- An ISPH scheme for the motion of rigid bodies in Newtonian fluids is presented.
- The scheme relies on combined use of rigidity constraints and viscous penalty.
- A viscosity ratio of 100 and weighted harmonic averaging was found satisfactory.
- The proposed scheme is easy to implement and circumvents explicit boundary conditions.
- The scheme is successfully tested for linear and rotational motion.
