Preconditioned iterative methods for fractional diffusion equation[☆]Fu-Rong Lin^{a,*}, Shi-Wei Yang^b, Xiao-Qing Jin^c^a*Department of Mathematics, Shantou University, Shantou Guangdong 515063, China*^b*Department of Mathematics, Shantou University, Shantou Guangdong 515063, China*^c*Department of Mathematics, University of Macau, Macao, China*

Abstract

In this paper, we are concerned with numerical methods for the solution of initial-boundary value problems of anomalous diffusion equations of order $\alpha \in (1, 2)$. The classical Crank-Nicholson method is used to discretize the fractional diffusion equation and then the spatial extrapolation is used to obtain temporally and spatially second-order accurate numerical estimates. Two preconditioned iterative methods, namely, the preconditioned generalized minimal residual (preconditioned GMRES) method and the preconditioned conjugate gradient for normal residual (preconditioned CGNR) method, are proposed to solve relevant linear systems. Numerical experiments are given to illustrate the efficiency of the methods.

Keywords: Fractional diffusion equation, Toeplitz matrix, FFT, Preconditioned GMRES method, Preconditioned CGNR method

1. Introduction

Fractional differential equations emerge from numerous topics such as turbulent flow [7, 27], chaotic dynamics of classical conservative systems [39], groundwater contaminant transport [4, 5], and applications in physics [28], finance [25], biology [18], and image processing [2]. Since there are very few fractional differential equations whose analytical closed-form solutions are available, the research on numerical methods for the solution of the equa-
