Searching for common patterns on protein sequences by means of a parallel hybrid Honey-Bee Mating Optimization algorithm

David L. González-Álvarez, Miguel A. Vega-Rodríguez, Álvaro Rubio-Largo

PII: S0167-8191(18)30097-8
DOI: [10.1016/j.parco.2018.04.001](https://doi.org/10.1016/j.parco.2018.04.001)
Reference: PARCO 2446

To appear in: *Parallel Computing*

Received date: 4 December 2015
Revised date: 5 April 2018
Accepted date: 6 April 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A hybrid (OpenMP/MPI) parallel multiobjective approach based on HBMO is proposed.
- We use as benchmark an important bioinformatics problem, the motif discovery problem.
- We conduct executions by using different number of cores to a maximum of 128 cores.
- Comparisons with parallel biological tools demonstrate the quality of our approach.
- Besides good parallel results, it also makes good biological predictions.
