Entropy and Orthogonality Based Deep Discriminative Feature Learning for Object Recognition

Weiwei Shi, Yihong Gong, De Cheng, Xiaoyu Tao, Nanning Zheng

PII: S0031-3203(18)30126-2
DOI: [10.1016/j.patcog.2018.03.036](https://doi.org/10.1016/j.patcog.2018.03.036)
Reference: PR 6514

To appear in: *Pattern Recognition*

Received date: 25 July 2017
Revised date: 2 March 2018
Accepted date: 27 March 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We propose a novel discriminative feature learning method of CNNs by enforcing the learned feature vectors to have class-selectivity.
- We propose the entropy-orthogonality loss (EOL) to explicitly enforce that each dimension of the feature vectors only responds strongly to as few classes as possible, and the feature vectors from different classes are as orthogonal as possible.
- We provide the optimization algorithm based on mini-batch for the proposed framework.
- Comprehensive experimental evaluations with both the image classification and face verification tasks demonstrate the effectiveness of the proposed method.
