This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Conventional graph based clustering methods treat all features equally even if they are redundant features or noise in the stage of graph learning, which is obviously unreasonable. In this paper, we propose a novel graph learning method to solve this problem and learn a more reasonable, interpretable, and robust graph for data clustering.
- By integrating the local distance regularization term into LRR, the proposed method can simultaneously exploit both global and local structures of data, which ensures to learn a more reasonable graph.
- The nonnegative constraint not only greatly improves the interpretability of the graph, but also guarantees each sample to be in the convex hull of its nearest neighbors.
- By introducing an adaptive weighted matrix to regularize the data reconstruction errors, the representation contribution of the most important features will be improved while those of the redundant features will be reduced in the self-representation so that a more robust graph will be achieved.
