Semi-Supervised Time Series Classification on Positive and Unlabeled Problems Using Cross-Recurrence Quantification Analysis

Lucas de Carvalho Pagliosa, Rodrigo Fernandes de Mello

PII: S0031-3203(18)30081-5
DOI: [10.1016/j.patcog.2018.02.030](https://doi.org/10.1016/j.patcog.2018.02.030)
Reference: PR 6477

To appear in: *Pattern Recognition*

Received date: 19 June 2017
Revised date: 9 February 2018
Accepted date: 25 February 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We show along this article that local differences enhanced by noise and mean-valued observations mislead classification when time-domain similarity measurements such as ED, DTW, DTW-D and MDDL are used. In addition, they lead to inconsistent classification due to the noise level.
- We propose the use of CRQA to improve semi-supervised classification on PU scenarios, specially on datasets containing recurrent observations (typically observed in real-world phenomena);
- Results show that CRQA has achieved better classification performances while classifying semi-supervised time series using the 1NN approach;
