Pedestrian Detection at Night time in FIR domain: Comprehensive Study about Temperature and Brightness and New Benchmark

Taehwan Kim , Sungho Kim

PII: S0031-3203(18)30041-4
DOI: [10.1016/j.patcog.2018.01.029](https://doi.org/10.1016/j.patcog.2018.01.029)
Reference: PR 6438

To appear in: *Pattern Recognition*

Received date: 31 May 2017
Revised date: 29 November 2017
Accepted date: 24 January 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The seasonal temperature based-pedestrian detection database was constructed.
- The seasonal brightness and temperature of the pedestrians at night were analyzed.
- The proposed temperature-based method outperforms the brightness-based baseline.
- The normalized physical temperature enhances the pedestrian detection performance.
