This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We propose the first model that can supervise Latent Dirichlet Allocation (LDA) by Gaussian Processes (GPs).
- LDA and GP are jointly trained by a novel variational inference algorithm that adopts ideas from Deep GPs.
- Differently from Supervised LDA (sLDA), our model learns non-linear mappings from topic activations to document classes.
- By virtue of this non-linearity, our model outperforms sLDA, as well as a disjointly trained cascade of LDA and GP in three real-world data sets from two different domains.
