This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Deep convolutional auto-encoder for anomaly detection in videos
- Fusion of low-level (frames) with high-level (appearance and motion features) information
- Study of the influence of video complexity in the classification performance
- Use of reconstruction errors from convolutional autoencoder as anomaly scores
- Case studies with real-world video clips
