The uncertainty learning filter: a revised smooth variable structure filter

Mark Spiller, Fateme Bakhshande, Dirk Söffker

PII: S0165-1684(18)30177-4
DOI: [10.1016/j.sigpro.2018.05.025](https://doi.org/10.1016/j.sigpro.2018.05.025)
Reference: SIGPRO 6833

To appear in: *Signal Processing*

Received date: 18 August 2017
Revised date: 29 March 2018
Accepted date: 21 May 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- An advanced version of smooth variable structure filter denoted as uncertainty learning filter is proposed for state estimation of nonlinear system in case of imprecise model description.
- Dependencies of the estimation performance on parameters can be avoided by introducing an uncertainty learning parameter which can be adapted online.
- The uncertainty learning parameter has the capability to tune the proposed filter according to the uncertainties present in the current model description.
- Boundedness of estimation error is proven for the adaptive filtering approach.
