This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights:

- A novel covariance adaption based Kalman filter is elaborated for linear time-invariant systems without *a priori* and accurate knowledge about the process noise covariance;
- The innovative idea of proposed covariance propagation scheme is to online calibrate the prior error covariance through feedback excavation of the posterior stochastic sequence;
- Without requiring any additional computational cost, proposed adaptive Kalman filter could significantly relax Kalman theory's constraint on accurate statistic knowledge of process noise.
