11 Abstract

12 Air pollution management and control are key factors in maintaining sustainable societies. Air
13 quality forecasting may significantly advance these tasks. While short-term forecasting, a few days
14 into the future, is a well-established research domain, there is no method for long-term forecasting
15 (e.g., the pollution level distribution in the upcoming months or years). This paper introduces and
16 defines *long-term* air pollution forecasting, where *long-term* refers to estimating pollution levels
17 in the next few months or years. A Discrete-Time-Markov-based model for forecasting ambient
18 nitrogen oxides patterns is presented. The model accurately forecasts overall pollution level
19 distributions, and the expectancy for tomorrow's pollution level given today's level, based on
20 longitudinal historical data. It thus characterizes the temporal behavior of pollution. The model
21 was applied to five distinctive regions in Israel and Australia and was compared against several
22 forecasting methods and was shown to provide better results with a relatively lower total error rate.

23 **Keywords:** Air pollution Modeling; Discrete-Time Markov model; Long-term forecasting;
24 Modeling; Risk assessment; Nitrogen dioxide (NO₂)

25 **Software availability:** Name of software: Long-Term Air-Pollution Forecasting; Developer: A.
