This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- Kelvin-Helmholtz type instabilites are prominent in non-horizontal film boiling
- The classical lubrication model is unable to predict such instabilites
- A hybrid potential-flow/lubrication model predicts angular dependence of stability
- Wavelengths are a combination of the Kelvin-Helmholtz and Rayleigh-Taylor kinds
