This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A stable numerical scheme for velocity/pressure/void fraction coupling in bubbly flows is presented.
- Bubble compressibility is incorporated into a two-phase solver with incompressible liquid.
- Pressure waves can be simulated for void fractions in the range 0.001 to 0.99.
- Tests and demonstrations are presented for 1D, 2D and 3D cases, including a ship hydrodynamics problem with complex geometry and overset grids.
- First time the two phase flow around the research vessel Athena could be simulated for high speed.
