The effect of interfacial waves on the turbulence structure of stratified air/water pipe flow.

A.A. Ayati, J. Kolaas, A. Jensen, G.W. Johnson

PII: S0301-9322(15)00205-0
DOI: [10.1016/j.ijmultiphaseflow.2015.09.007](https://doi.org/10.1016/j.ijmultiphaseflow.2015.09.007)
Reference: IJMF 2283

To appear in: *International Journal of Multiphase Flow*

Received date: 19 January 2015
Revised date: 4 August 2015
Accepted date: 15 September 2015

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Experimental study of stratified gas-liquid flow.
- Combination of PIV, Conductance Probes and Hot Wire.
- Visualization of wave-shed eddies in gas-phase.
- HW and CP spectra show low-frequency fluctuations in gas are due to waves.
- HW-spectra indicate possible interaction between gas-turbulence and waves.
