Title: TGA-FTIR investigation on the co-combustion characteristics of heavy oil fly ash and municipal sewage sludge

Authors: Xiangguo Li, Wenjuan Miao, Yang Lv, Yingbin Wang, Changsheng Gao, Dongbing Jiang

PII: S0040-6031(18)30285-5
DOI: <https://doi.org/10.1016/j.tca.2018.05.023>
Reference: TCA 78011

To appear in: *Thermochemica Acta*

Received date: 28-2-2018
Revised date: 2-5-2018
Accepted date: 25-5-2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

TGA-FTIR investigation on the co-combustion characteristics of heavy oil fly ash and municipal sewage sludge

Highlights

- The blends ignite and burn out in advanced.
- The maxima of combustion indices occur at the ratio of 80% HOFA.
- Co-combustion of HOFA and MSS mainly releases CO₂, CO, and SO₂.
- SO₂ emission is retained due to the conditioner (CaO) in MSS.
