This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

1. This work presents an electrostatically-driven bi-axial micro-scanner with capacitive position sensing for Lissajous scanning projection.
2. With the added sensing capability, a PLL (phase-locked loop)-based oscillator loop is developed to sustain mechanical resonance and to provide mirror position information, which are equally important for practical applications.
3. The micro-scanner and the required circuits are implemented using bulk micromachining silicon-on-insulator and 0.35- μm CMOS (complementary metal oxide semiconductor) technologies, respectively.
4. The measured resonant frequencies of the bi-axial micro-scanner for the slow and fast-axis scans are 1.4 and 21.9 kHz, and the associated optical scan angles are 22.5° and 40°, respectively, under 48 and 115 V_{pp}.
5. The fabricated micro-scanner is adopted in a laser beam scanning projection system to achieve WVGA (852 × 480) display resolution.
