Highlights

- An impedimetric biosensor based on P3-TMA was developed for detection of IL-1 β .
- P3-TMA provided a lot of carboxyl groups for antibody binding.
- The modified immunosensor had a wide linear detection range of 0.01-3 pg/mL
- Furthermore, this biosensor had a low detection limit 3 fg/mL.
- This immunosensor had good selectivity and stability for IL-1 β detection.

Abstract

A new impedimetric immunosensor was fabricated for detection of Interleukin 1 β (IL-1 β) by using semi-conductive poly(2-thiophen-3-yl-malonic acid) (P3-TMA) as an immobilization matrix material and anti-IL-1 β antibody as a biorecognition element for the first time. The polymer P3-TMA bound onto hydroxylated ITO surface via ester bond to form a polymer
