Highlight

- Nanostructures *p*-CoO_x/*n*-SnO₂ designed for selective H₂S detection
- Tuning of sensor properties is based on catalytic activity of cobalt oxides
- Removal of *p* – *n* junction provides excellent selectivity of CoO_x/SnO₂ in H₂S detection

Abstract

Nanostructures *p*-CoO_x/*n*-SnO₂ based on tin oxide nanowires have been prepared by two step CVD technique and characterized in detail by XRD, XRF, XPS, HAADF-STEM imaging and EDX-STEM mapping. Depending on the temperature of decomposition of cobalt complex during the second step of CVD synthesis of nanostructures cobalt oxide forms a coating and/or isolated nanoparticles on SnO₂ nanowire surface. It was found that cobalt presents in +2 and +3 oxidation states. The measurements of gas sensor properties have been carried out during exposure to CO (14 ppm), NH₃ (21 ppm), and H₂S (2 ppm) in dry air. The opposite trends were observed in the
