This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Higher order scheme is presented for two-dimensional inhomogeneous sine-Gordon equation with impulsive forcing representing defect.
- Spectral stability analysis gives implicit expression for critical time step. Moreover, error analysis gives optimal rate of convergence.
- Various two-dimensional test cases of sine-Gordon equation are solved to show the efficacy of the proposed scheme.
