Block-accelerated aggregation multigrid for Markov chains with application to PageRank problems

Zhao-Li Shen, Ting-Zhu Huang, Bruno Carpentieri, Chun Wen, Xian-Ming Gu

PII: S1007-5704(17)30419-7
DOI: [10.1016/j.cnsns.2017.11.031](https://doi.org/10.1016/j.cnsns.2017.11.031)
Reference: CNSNS 4388

To appear in: *Communications in Nonlinear Science and Numerical Simulation*

Received date: 8 January 2015
Revised date: 22 November 2017
Accepted date: 28 November 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Aggregates on each level are also utilized to transfer the probability equation of that level into a block linear system that would be nearly block diagonally dominant.
- A Block-Jacobi relaxation is constructed based on the block linear system on each level for smoothing error more efficiently than the point-wise Jacobi relaxation.
- On each level, this Block-Jacobi relaxation is implementable, and it can maintain the positivity of approximate solutions and can converge to a nontrivial solution of the probability equation.
- An adaptive strategy enables this relaxation algorithm to avoid operations with dense matrices when solving PageRank problems.
- Various numerical experiments illustrate the effectiveness of this technique on accelerating the adaptive algebraic aggregation multigrid method and its variants for solving Markov chain problems, especially PageRank problems.
