This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- In current work, we consider two new numeric methods for simulating tumor growth model.
- Two methods which are applied in the present paper are meshless methods.
- One of them is based on collocation approach and another one is based on local weak form.
- To apply collocation technique, moving least squares(MLS) and radial basis functions(RBFs) are used.
- The required derivatives are approximated by the direct approach in MLS approximation.
- The MLS approximation is considered in the implementation of the MLPG technique.
- Some numerical examples (They include one 3dimensional case) are verified in this work.
