This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A parallelised dynamic mesh strategy is proposed using OpenFOAM(R).
- The new strategy can address conservatively partially-overlapped interfaces.
- Large deformations are solved with the combination of layering and mesh deformation.
- The parallel implementation has shown an efficiency higher than 85 percent.
- Robustness and convergence are proved solving an internal combustion engine.
