This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- An algorithm for modeling of rolling contact fatigue damage accumulation is proposed.
- The amplitude of maximum shear stress is adopted as a criterion for fatigue failure.
- Rolling contact fatigue curves for wheel steels of different hardness are obtained.
- Effect of the wheel steel hardness on accumulation of the RCF damage is investigated.
