This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

## Highlights

- A dynamic analytical model is developed to predict the dynamic response of metal foam core sandwich plates struck by heavy mass with low-velocity.
- Large deflection effect is included in analysis by considering the interaction between the plastic bending and stretching.
- The dynamic response and energy absorption of the sandwich plates depend on the impact location of the striker.
