Specific cutting energy modeling for turning nickel-based Nimonic 90 alloy under MQL condition

Chetan , S. Ghosh , P.V. Rao

PII: S0020-7403(18)31505-4
DOI: [10.1016/j.ijmecsci.2018.07.033](https://doi.org/10.1016/j.ijmecsci.2018.07.033)
Reference: MS 4445

To appear in: *International Journal of Mechanical Sciences*

Received date: 8 May 2018
Revised date: 11 July 2018
Accepted date: 24 July 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Pseudo-analytical model has been developed for predicting the specific cutting energy under sustainable MQL mode.
- The model takes into consideration both the shearing and frictional energy components.
- Specific frictional energy at the secondary shear zone has been modeled using the dual contact zone theory.
- Coefficient of friction in the sliding zone for the frictional energy has been obtained using open tribo meter tests.
