This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

### Highlights

- The results show that the dynamic ultimate compressive loads increase with the increase of strain rates.
- The empirical formulation proposed in the present paper can be used to predict the dynamic compressive ultimate strength of ship plates under dynamic in-plane loads.
- The developed method was applied to the outer bottom plate of container ships and an oil tanker successfully.
- Nonlinear material model in terms of the relationship between stress and strain is considered in the paper.
