This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- A simple and efficient method to suppress excess vibration on an arbitrarily supported rectangular damped plate subjected to steady-state harmonic excitations is developed.
- An efficient procedure is developed to identify sets of feasible attachment locations for the vibration absorbers when three or more nodes are enforced.
- A procedure is proposed to tune the absorbers under the constraint of the tolerable vibration amplitude for the damped oscillators.
