This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- A novel surface definition is used to design the non-axisymmetric stator casing of a 1.5 stage axial turbine.
- A newly formulated guide groove approach is shown effective for limiting secondary flow interactions.
- Computer-based optimization of the surface topology was demonstrated using APOW.
- Useful performance gains are achieved at design, +0.69% in stage isentropic efficiency and -3.88% in row total pressure loss.
- Effective strong secondary flow conditioning produces a 0.73% efficiency gain off-design.
