This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Experimental measurement of axis orbit in twin-screw compressor is achieved, which is hardly seen elsewhere.
- A two-phase flow model is presented to calculate axis orbit of journal bearing.
- Axis orbit is located at the second quadrant and is close to an ellipse with six fluctuations.
- A few refrigerant dissolved in oil is beneficial to the stability of rotor-bearing system.
- It tends to adopt journal bearing with small radius clearance and aspect ratio.
