Analysis And Prediction Of Chilled Water Plant Performance Based On Multivariate Statistical Methods And Large Historical Data

Philip Beaulieu St-Laurent , Louis Gosselin , Carl Duchesne

PII: S0140-7007(18)30111-7
DOI: 10.1016/j.ijrefrig.2018.04.005
Reference: JIJR 3945

To appear in: *International Journal of Refrigeration*

Received date: 22 December 2017
Revised date: 2 April 2018
Accepted date: 3 April 2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- PCA explains up to 80% of the variance in a chiller operation with only 2 components
- The first component is driven by weather, the second by operation set points
- PLS can predict present and future COP values, up to 3h in advance, with R^2 = 77%
- PCA/PLS effectively extract useful knowledge from the large historical dataset
