This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Investigation on Influences of Initial Residual Stress on Thin-walled Part Machining Deformation Based on a Semi-Analytical Model

Graphical Abstract

$$\frac{1}{R_{x,i-1}} - \frac{1}{R_{x,i}} = \frac{6th_i f_i (\sigma_{x,i-1} - \mu \sigma_{y,i-1})}{Eh_i^3 \rho_{eqv,i}}$$

$$S_{x1} = -\frac{6th_i \sigma_{x1}}{h_i^3 \rho_{eqv1}} \left(\frac{h_i^3}{6h_i h_{z1}} + 0.5h_{z1} \right)$$

Proposed semi-analytical model

Model validation
via FEM simulations and experiments

$$w\left(\pm \frac{L}{2}, \pm \frac{W}{2}\right) = \sum_{i=1}^k (c_{x,i} \sigma_{x,0,i} + c_{y,i} \sigma_{y,0,i})$$

Quantitative relationship between initial residual stress and machining deformation

Discussions:

- Influences of equivalent bending stiffness and residual stress on the machining deformation;
- Control strategies of the machining deformation;

Abstract

The manufacturing accuracy of the thin-walled parts is significantly affected by the residual stress in the blank and the resulting machining deformation. In recent years, the prediction and control of the machining deformation have received extensive attentions. A semi-analytical machining deformation prediction model is proposed for the thin-walled parts in terms of the equivalent bending stiffness calculated by finite element method (FEM) simulation and theory
