Propagation and Dissipation of Elasto-Plastic Stress Waves in Two Dimensional Ordered Granular Media

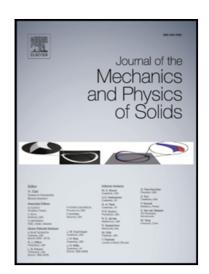

Robert F. Waymel, Erheng Wang, Amnaya Awasthi, Philippe H. Geubelle, John Lambros

PII: S0022-5096(17)30463-5 DOI: 10.1016/j.jmps.2017.11.007

Reference: MPS 3223

To appear in: Journal of the Mechanics and Physics of Solids

Received date: 15 June 2017
Revised date: 28 September 2017
Accepted date: 9 November 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- An experimental setup is constructed to elasto-plastically load 2D ordered granular media and embedded piezoelectric sensors record the arrival time and force profile at certain locations within the packing.
- Elasto-plastic wave propagation in a 2D ordered granular system is modeled using the molecular dynamics simulator LAAMPS.
- Diameter tolerance is included in the simulations to mimic the effect of gaps in the experimental setup and the resulting numerical scatter in arrival time and peak force is similar to the experimental scatter for those quantities.
