This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A constitutive nonlinear thermo-viscoelastic relation is developed for an orthotropic rubbery thin film up to the onset of plasticity.
- The presented plane stress formulation involves the free volume theory of viscoelasticity and the time-temperature superposition principle.
- The constitutive model is implemented in a commercial finite element code by means of a user-defined subroutine.
- Experiments at different temperatures (from 24°C to -50°C), strain rates (from 0.001%/s to 1%/s), and mechanical loading conditions (diaphragm inflation tests and uniaxial tension, relaxation and cyclic experiments) are considered.
