Analysis of three-dimensional hexagonal and cubic polycrystals using the boundary element method

Andres F. Galvis, Rene Q. Rodríguez, Paulo Sollero

PII: S0167-6636(17)30337-X
DOI: [10.1016/j.mechmat.2017.10.009](https://doi.org/10.1016/j.mechmat.2017.10.009)
Reference: MECMAT 2810

To appear in: *Mechanics of Materials*

Received date: 15 May 2017
Revised date: 6 September 2017
Accepted date: 12 October 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We evaluate the macroscopic elastic properties of HCP and FCC polycrystals using BEM.
- Anisotropy level and elastic properties were extensively compared with references.
- We used the new 3D anisotropic fundamental solution based on double Fourier series.
- The Fourier coefficients allow the efficient evaluation of the BEM matrices.
- A parallel algorithm is presented and an efficient solver based on MPI is applied.
