This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- A comprehensive thermo-viscoelastic model is developed to simulate the self-heating behavior
- A micromechanics-based model predicts effective viscoelastic behavior of composites
- A first-order shear deformable beam theory is formulated to evaluate the heat generation
- Experiments of composite beams under near-resonant excitations validate the model
- The test-based modeling framework provides a practical tool for design and development of energetic composites
