This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

ACCEPTED MANUSCRIPT

Highlights

- Instrumented indentation is performed on various metals and alloys.
- Frame compliance of the instrument is taking into account for accurate measurements.
- A new relationship between the elastic recovery energy to the total work-of-indentation ratio and the applied load to the square of the contact stiffness ratio is proposed.
- A proportionality factor has been found by both finite elements method and inverse analysis for the material presenting an intermediate mechanical behavior.
- > The values of elastic modulus obtained from the new relationship are in a very good agreement with the theoretical values given in literature.
